

## Phonak EduLink

1c

Phonak MicroLink™

The EduLink is a small, neat earworn fm receiver with a 'high tech' contemporary appearance. It is usually used with a Campus SX transmitter and provides enhanced personal listening. Use with other fm transmitters is possible.

Studies carried out in the USA and Europe have already shown that this type of device, integrating the latest wireless fm technology, can make a huge difference to the learning ability and performance of an increasing number of children with learning disabilities.

A wide variety of learning disabilities characterise children with specific performance deficits. These children may have difficulties writing down words and numbers, may be distracted easily or may withdraw from social interaction. One thing they have in common, however, is difficulty in filtering speech from environmental noise. This puts them under additional strain in the classroom.

EduLink feeds the teacher's voice directly to the child's ear, effectively reducing distracting background and ambient noise. The teacher wears an fm transmitter and a microphone. The speech is then sent to the EduLink receivers on the child's ears.

EduLink greatly improves speech understanding in the classroom. This has a very positive influence on therapy and ends the children's frustration because they find it easier to concentrate and learn.

EduLink is typically used to complement existing therapies in children with Auditory Processing Disorder (APD), Attention Deficit/Hyperactivity Disorder (ADHD) or specific Learning Disabilities (LD).
