

The IR Classmate Infra Red Soundfield System

The IR Classmate soundfield system is an excellent choice for school, college and university soundfield installations.

A unique feature of the Connevens IR Classmate is that the receiver/amplifier is in a secure wall mounted box, making it the most sensible choice for classrooms with unsupervised access.

With options of 4 or 6 wall speakers plus ceiling tile speakers, an IR Classmate system can be installed in complex shaped rooms.

Infra red systems have the advantage of requiring no radio frequency or channel planning as the infra red signals are kept within the classroom walls, which means there is literally no technical limit to the number of systems which may be installed on a site.

Designed with Connevens care and attention to detail

The IR Classmate has a number of appealing design features – apart from the secure wall mounted metal box. The IR Classmate amplifier is automatically turned on when the cupboard is unlocked. The IR Classmate has a special control circuit that reduces background hiss and the chance of sustained acoustic feedback. **The whole system provides a clear and natural listening experience with a quality of sound that is the best in the market.**

Security by design The IR Classmate transmitters and accessories fit neatly into the door of the unit for secure storage

Charging made easy At the end of the day when the cupboard door is locked, the wall unit will recharge the transmitter (as long as you have plugged it in!) and then automatically turn itself off when the charge cycle is complete.
